Reflect on the topic

Working silently and individually, have each person create a few sticky notes in all four quadrants below for about five minutes. With the remaining time, discuss notes in each quadrant.

What went well?

What should we keep doing? What should we celebrate? Where did we make progress?

1.Promote international cooperation: Addressing global CO2 emissions will require international cooperation and collaboration. International organizations should continue to work together to develop and implement effective policies and initiatives.

> 2.International cooperation: A global CO2 emission analysis can also highlight the need for international cooperation in addressing climate change and it hurts the environment too. It can serve as a reminder that reducing emissions requires a collective effort from all countries and that no single nation can solve the problem on their own.

1.Developing joint policy

recommendations: Collaborating to

develop joint policy

recommendations can help to inform

national and international policies

and strategies for reducing global

CO2 emissions. Experts from

different organizations, institutions,

and countries can collaborate to

develop policy recommendations

that are based on environmental,

social, and economic considerations.

2.Improved data

collection and analysis:

Improved data collection

and analysis can help to

provide more accurate

and comprehensive

information on global

CO2 emissions.

What ideas do you have for future work together?

Where do you see opportunities to improve?

What ideas do you have?

What has untapped potential?

Workstation engineering team

3.Increased global cooperation: The Paris This has led to need to address climate

Agreement on climate change, which was signed in 2015, has resulted in increased global cooperation and commitment to reducing CO2 emissions. a greater awareness of the change.

TOPIC

Sprint 10

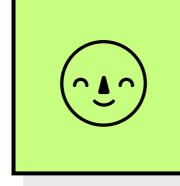

1.Political barriers: Some countries may be hesitant to report their emissions accurately, either due to political reasons.

What went poorly?

Where did we have problems? What was frustrating to us or others? What held us back?

> 2.Slow progress: Despite increased awareness and commitments to reduce emissions, progress in reducing global CO2 emissions has been slow, and many people feel that not enough is being done to address the issue. So co2 increasing day by day.

3.Lack of investment: Investment in research and development of low-carbon technologies, as well as in infrastructure to support the transition to a low-carbon economy, has been insufficient in some areas and a focus on short-term goals over longterm sustainability.

3.Applying interdisciplinary

approaches: There is an

opportunity to apply

different fields such as

sociology, and ecology to

interdisciplinary approaches to global CO2 emission analysis, bringing together experts from contribute to climate change, develop more comprehensive and nuanced understandings of the drivers of carbon emissions.

2.Increase the scope of

analysis: The analysis of

global CO2 emissions

should be expanded to

include other greenhouse

gases, such as methane as

well as other pollutants that

such as black carbon.

1.Increase investment in lowcarbon technologies: Continued investment in research and development of low-carbon technologies is essential to reduce global CO2 emissions. This includes technologies such as renewable energy, carbon capture and storage, and electric vehicles.

> 3.Stakeholder engagement: Stakeholders, including industry, civil society should be engaged in the process of addressing global CO2 emissions. This includes creating opportunities for input and feedback, as well as collaboration and partnership

in implementing solutions.

How should we take action?

What do you believe we should do next? What specific things should we change? What should extend beyond this meeting?
